Press Release MultiSpeedMaster

s.tec Germany GmbH presents an intelligent solution for an optimized workflow in the field of Smart-Repair.

Innovation – Quality – Professionalism and Efficiency

For many decades s.tec Germany GmbH has been the leading manufacturer in the field of the source extraction of gases, fumes and dust. s.tec Germany offers solutions for health protection in the workplace and optimizes workflows in the field of Smart-Repair.

At the TASC s.tec Germany GmbH presents an innovative Smart-Repair solution. The MultiSpeedMaster is a professional working bay that allows all Spot-Repair processes, like grinding, painting, drying and finishing at the same place.

The equipment consists of a light-weight steel frame resting on four pillars which is surrounded by a transparent curtain. It can be integrated in any part of the workshop and requires only 4.5 x 7m of space. The basic framework is self-supporting. It separates off the smart repair workstation from the workshop while still being able to incorporate the required installations such as easily movable supply and exhaust hoods with integrated filter technology. The equipment is not subject to approval due to the low level of pollutants in spot repair and has also received the GS mark for safety.

Depending on the MSM version, the working bay provides a second extraction hood, an infrared dryer, a high vacuum suction, Cleaning devices or a lifting platform.
